

The myths of rain

Dr.M.Azizur Rahman

Optimum temperature and rainfall is needed for agro production.

Fresh water and agriculture have a positive correlation.

Ground water gradually goes down for climatic variation.

Due to rising temperature the earth surface is getting into desertion.

Agriculture and salinity have a negative association

The coastal life is facing a threat for salinity intrusion.

Coastal salinity makes it difficult for farm irrigation

Coastal zones with salinity become difficult for cultivation.

Among the much affected sectors is agricultural production.

As the sea level rises, Maldivians are getting ready for migration.

Coastal zones with salinity become difficult even for plantation.

Climate change is also affected by deforestation and urbanization.

Instead of deforestation people must go for tree plantation.

Effective solution to the problem of climate change is adaptation.

We save the world with responsibilities through a fair distribution.
