

Private Sector Productivity

The association between private sector and productivity is logical.

Because gain and ownership belongs to the private individual.

In religion, appreciation of private ownership is very usual.

The relation between productivity and ownership is logically causal.

Relation between government ownership and productivity is not professional.

Growth and development expansion in private sector is visual.

National & per capita GDP & their growth become substantial.

Example of Asian tigers and their high growth is tropical.

Agricultural productivity of North-Bengal is an example of peripheral.

To distribute income and alleviate poverty, we have to be tactical.

Input-output relation in public sector is only mechanical.

Correlation between ownership and productivity is practical.

As the relation between ownership & productivity is economical.

So, development phase can be transferred from agriculture to industrial.

All it means, the private sector expansion is necessarily critical.

So, increased production and consumption will result as gradual.

Standard life and living will be very clear in our optical.
